Dear Hiring Team,

I'm writing to express my interest in a software engineering role on your team. I hold an M.S. in Computer Science from Northeastern University (3.9 GPA, expected December 2026), an AWS Solutions Architect certification, and over 2.5 years of professional software engineering experience.

At Manhattan Associates, I worked as a Software Engineer building real-time systems for warehouse management platforms used by global clients. I designed a message processing framework in Java, C++, Spring Boot, and RabbitMQ that reduced communication latency by 30%, led a migration from SOAP-based integrations to REST-based JSON messaging, and resolved 150+ production issues across 20+ deployments. That experience taught me how to build systems that have to work under load, under pressure, and across teams, and I was recognized with two company-wide engineering awards.

At Wintergreen, a startup, I worked as a Full-Stack Developer building reporting and analytics infrastructure. I owned an end-to-end pipeline for healthcare cost data across four layers (SQL, Node/Express APIs, JasperReports, and a React Native client), introducing the stack into the company myself, and designed RESTful APIs to integrate legacy systems built in PHP and Laravel.

Outside of work, I build constantly. I co-built Arcanum (arcanumverse.org), a story-driven puzzle platform with React, Three.js, FastAPI, and PostgreSQL that drew 12K+ submissions on launch day. I built WarehouseFlow, a distributed order-routing engine in Go with Kafka, Redis, and PostgreSQL on AWS, validated through failure experiments with zero data loss on failover. And I built AlphaWealth, a finance AI platform integrating multiple LLM backends with RAG, FinBERT, and a native C++ signal engine. I also use AI tools like Claude Code daily and critically evaluate their output rather than accepting it at face value.

I work across Java, C++, Go, TypeScript, and Python, and I'm comfortable with Spring Boot, Node.js, AWS, Docker, Kubernetes, Kafka, and PostgreSQL. I care about building systems that are reliable, observable, and built to scale, and I bring that mindset whether the problem is backend infrastructure, API design, or full-stack delivery.

I'd welcome the opportunity to discuss how my experience can contribute to your team.

Best regards,

Nithish Kadam Ganesh
